NOTE 20 Fair Value Measurements

A.	Fair Value Measurements
	SSAP No. 100, Fair Value Measurements, clarifies the definition of estimated fair value and establishes a hierarchy for measuring estimated fair value. The hierarchy established by this standard consists of three levels to indicate the quality of the estimated fair value measurements as described below.
	Level 1 - Quoted Prices in Active Markets for Identical Assets and Liabilities: Unadjusted quoted prices for identical assets or liabilities in active markets that are readily and regularly obtainable.
	Level 2 - Significant Other Observable Inputs: Quoted prices in markets that are not active or inputs that are observable either directly or indirectly. These inputs can include quoted prices for similar but not identical assets or liabilities other than quoted prices in Level 1.
	Level 3 - Significant Unobservable Inputs: Prices or valuation techniques that require inputs that are both unobservable and significant to the overall fair value measurement. Inputs reflect management's best estimates of the assumptions market participants would use at the measurement date in pricing the asset or liability. Consideration is given to the risk inherent in both the method of valuation and the valuation inputs. Primary inputs to this valuation technique include broker quotes, comparative trades, and independent third-party providers.
	The Company reviews its fair value heirarchy classifications for assets and liabilities quarterly. Changes in observability of significant valuation inputs identified during these reviews may trigger reclassifications in or out of Level 3. Reclassifications are reported as transfers at the beginning of the period in which the change occurs.
	The estimated fair values for substantially all bonds, including loan-backed and structured securities, unaffiliated common stock and certain short-term investments are based on quoted prices or quotations on comparable securities in active markets that are readily and regularly obtainable. Valuation of these securities does not involve management's judgement.
	When quoted prices in active markets are not available, the determination of estimated fair value is based on market standard valuation methodologies, giving priority to observable inputs. The significant inputs to the market standard valuation methodologies for certain types of securities with reasonable levels of price transparency are inputs that are observable in the market or can be derived principally from or corroborated by observable market data.
	When observable inputs are not available, the market standard valuation methodologies for determining the estimated fair value of certain types of securities that trade infrequently, and therefore have little or no price transparency, rely on inputs that are significant to the estimated fair value that are not observable in the market or cannot be derived principally from or corroborated by observable market data. These observable inputs can be based in large part on management's judgement or estimation, and cannot be supported by reference or maket activity. Even though these inputs are unobservable, management believes they are consistent with what other market participants would use when pricing such securities and are considered appropriate given the circumstances.

NOTE 25 Change in Incurred Losses and Loss Adjustment Expenses

Reserves for the Company's incurred losses and loss adjustment expenses (after intercompany pooling) attributable to insured events of prior years reflect favorable development totaling \$774,222. The development can be attributed primarily to the re-estimation of unpaid losses and loss adjustment expenses in the workers' compensation and products liability lines of buisness. The favorable development in these lines was slightly offset by losses in commercial multi perils, commercial auto liability, homeowners and farmowners, private passenger auto liability, auto physical damage, other liability, and other lines of business. The changes reflected in these lines were generally the result of recent development trends. There were not any premium adjustments made as a result of this loss and loss adjustment expense development.

NOTE 33 Asbestos/Environmental Reserves

A. Does the company have on the books, or has it ever written an insured for which you have identified a potential for the existence of a liability due to asbestos losses?

Yes. The Company had exposure to asbestos losses during the periods reported. Direct exposure arose from the sale of general liability business. The Company also had exposure through its unaffiliated reinsurance assumed operations and an intercompany pooling arrangement (reference Note 26). The Company estimates the impact of its direct exposure by establishing case reserves on all known losses and by computing IBNR losses based on previous experience. The Company relies on case and IBNR reserves established by the Excess Casualty Reinsurance Association and the Mutual Reinsurance Bureau to measure its exposure from unaffiliated reinsurance assumed operations.

The Company's asbestos and environmental related losses for calendar years 2018-2021 have been restated to reflect the pooling changes that were effective January 1, 2022. See Note 26 for details.

GENERAL INTERROGATORIES

PART 2 - PROPERTY AND CASUALTY INTERROGATORIES

6.1

What provision has this reporting entity made to protect itself from an excessive loss in the event of a catastrophe under a workers' compensation contract issued without limit of loss?
Those Companies that concentrate in the Workers Compensation business, and which the Company has exposure to through the intercompany pooling arrangement, purchase catastrophic reinsurance at levels that are deemed adequate to protect against excessive loss. In addition, losses arising from claims under the federal black lung programs for dates of injury prior to 2016 are subject to ADC arrangement related to black lung claims. In addition, single locations, where excessive concentration of potential losses have been identified, are subject to facultative reinsurance above the layers contained in the catastrophic policies.

6.2

Describe the method used to estimate this reporting entity's probable maximum insurance loss, and identify the type of insured exposures comprising that probable maximum loss, the locations of concentrations of those exposures and the external resources (such as consulting firms or computer software models), if any, used in the estimation process.
The Lead Company in the pooling arrangement performs a concentration of risk study using modeling software to determine the probable maximum insurance loss. The software utilized includes Risk Management Solutions (RMS) RiskLink and Verisk Touchstone catastrophe models. Analysis is performed for the perils of hurricane, severe convective storm, winter storm, and earthquake. The PML driver on low return periods (~20 years) is severe convective storm. Starting around the 100 year return period, hurricane becomes the largest driver of the PML. The highest concentration of exposure (total insured value) is in Ohio. Ohio also has the highest gross average annual loss (Gross AAL). Several of the top 10 county concentrations are in Ohio, with the other top counties being in Kentucky, Nebraska, Indiana, and West Virginia. The Encova Mutual Insurance Group utilizes Guy Carpenter's AdvantagePoint tool to analyze and manage property risk. The Group to which this Company is a party through its pooling arrangement works with reinsurer brokers to assist in developing maximum probable losses. Both Property and Casualty exposures are analyzed for probable maximum loss and include various scenarios.

6.3

What provision has this reporting entity made (such as a catastrophic reinsurance program) to protect itself from an excessive loss arising from the types and concentrations of insured exposures comprising its probable maximum property insurance loss?
The Company purchases catastrophic reinsurance at levels that are deemed adequate to protect against excessive loss.
